That popularity is owed to Honda's legendary reliability, but even the best engine needs occasional maintenance. If the engine needs to be run for any reason, make sure it's located in a well ventilated area to prevent carbon monoxide poisoning. This may need to be done more frequently if the engine is used in dusty areas. Some models have a gear reduction case that holds oil. Look on the side of the motor next to the output shaft for a large metal case. Make sure the oil comes up to the marks

The inside of the cyclone housing can be accessed by removing three screws on the top of the cover. Clean the base and refill with 2 oz. 60 cc of fresh oil. Once dry, soak the foam in fresh oil and squeeze out any excess. Replace the oring if it has been damaged. 4. Screw the cup and oring into the carburetor. Replace the arrester if it is cracked. 6. Failure to check all levels will result in pressure washer damage. Most pumps are shipped with oil from factory and the crankcases are sealed; you may have to remove a shipping plug and install a dipstick in the pump. Oil type is stated on the pump breakdown and in the engine book. You can check your GPM by using a 5 Gallon bucket and a timer.

If your machine is 5 GPM or less and the bucket fills in less than a minute you have adequate supply. Some systems are effected by things like washing machines, livestock watering systems and flushing of toilets. Be sure the supply is still adequate when these operations are taking place. The water temperature cannot exceed 145 Degrees Fahrenheit on the standard models and 180 degrees Fahrenheit on the high temperature models and the pressure should not exceed 60 PSI. Failure to secure adequate water supply to your commercial pressure washer will result in pump damage. Although there are small filters installed on power washers that filter the water, they could only filter poor quality water for a short period of time before they clog. This would result in damage to the machine. Therefore you should insure no sand or scale particles are present in the water supply. This 15' length helps isolate the water supply from pulsations from the pump. Many states require a Vacuum Break or back flow prevention be installed at the hydrant, before the garden hose, to insure the water source cannot be contaminated. Be sure to check local and state regulations upon installation. Look for water leaks and stop any leak found. Leaks can cause erratic pump behavior. This circuit should be installed by a licensed electrician and checked to supply adequate voltage Under Load. Sometimes the distance from the panel is too long, the wire size is too small or the voltage is initially too low, this will cause the GFCI or Thermal to trip. If the GFCI trips or the thermal overload on the motor trips consult factory. Plug your cord into the receptacle. Pull trigger gun and check for adequate pressure. During operation do not leave the machine running for more than 2 minutes without the trigger gun being pulled. Although your machine has a bypass valve on it and may have a thermal relief system, this can cause extensive pump damage.

If machine will not be discharging water for more than 2 minutes, shut the machine off. Your machine is supplied with interchangeable spray tips. The black tip lowers your pressure and draws chemical. The other tips are for high pressure rinse at different spray angles. Red is 0 degree, yellow is 15 degree, green is 25 degree and white is 40 degree. The yellow tip is used for most standard applications. Be sure the quick coupler is fully engaged before pulling the trigger gun. Failure to do so may result in the tip becoming a projectile and may be lost or damage to property or persons may occur. See the table to choose the right nozzle for your machine. Be sure to use the black, low pressure nozzle to inject chemical. The chemical injector will only open up and allow chemical into the line when this tip is used. This tip enables the pressure to drop to approximately 250 PSI to draw chemical. The injector can be shut on and off or the rate of injection can also be set by turning the knob that the clear vinyl tube attaches to. See calibration below. Be sure to flush injection system with clear water after use. The nozzle must be pulled back toward the gun for high pressure rinse. When the nozzle is moved forward you will have low pressure and the soap injector will start to draw chemical. This will lower your pressure and allow the injector to start to draw chemical. Chemical will only be drawn in the low pressure setting. Pull nozzle back for high pressure rinse. Additional hose added to the machine may change the performance of the machine. Consult factory if you have

any questions. When replacing or disconnecting the quick couplers be sure the machine is shut off and relieve the pressure from all hoses. A 50% antifreeze solution may be drawn in through the inlet of the pump using a short remnant of garden hose. This fluid should be run through the pump when the fluid is discharged from the pump discharge your machine is winterized. Do not allow machine to freeze.

Repair or replace as needed. Other repairs are more straightforward; you can do them yourself. This article focuses on basic small engine troubleshooting, in particular, for the four stroke GX120, the GX160, and the GX200 Honda small engines. The GX120, GX160, and GX200 are horizontalshaft, singlecylinder engines that replaced the existing models. Examples are construction and industrial equipment, generators, and agricultural equipment. They are also suitable for pressure washers and water pumps. They have a reputation for their fuel economy as well as durability and reliability. Keep in mind these are broad small engine troubleshooting tips. If your engine does not start, the most obvious thing to check is that it has not run out of petrol. Make sure that you are using straight petrol for a 4 stroke engine. It is extremely hard to start a machine with stale fuel. When you leave fuel in the engine for an extended period, you can clog the carburetor. After some time, parts within the fuel evaporate. Clean it with carburetor cleaner and if that doesn't work, you will have to replace or rebuild the carburetor. The engine receives too much fuel if the carburetor choke isn't closing as it should. Another common cause is a faulty fuel cap. A faulty cap keeps the engine from starting or makes it harder to start the engine. The gas cap has a small vent that allows air to enter the gas tank and relieve pressure. If that vent becomes clogged, the pressure in the tank will rise. Loosen the gas cap before you start the engine. If the engine continues to run with the loose cap, the vent is more than likely clogged. You may see a cracked insulator, a burnedaway or damaged electrode, or heavy carbon buildup. If so, replace the spark plug. You should see a strong spark between the tester's terminals when the engine is cranking. If you don't, the spark plug is defective. The sticky stuff left behind clogs the fuel filter and interferes with engine operation.

Then, replace the fuel filter. A faulty ignition coil keeps the engine from starting. Check that the spark plug is working. Replace the ignition coil if needed. If the recoil starter assembly is faulty, your engine will not start. To troubleshoot, remove the starter assembly. Pull the starter rope. This turns the engine. Release the rope. The tabs are supposed to retract. Then the rope should rewind on the pulley. To see if the switch is defective, use a multimeter. Test for continuity. Either one can prevent the engine from starting if it's faulty. It fits in the crankshaft, where it engages with the flywheel. This prevents engine damage. Replace the flywheel key before troubleshooting further. Maintaining your equipment yourself can save you a great deal of time and money. That where we come in. Seems to be written for experienced mechanics While I have yet to do any major repairs with this one, just looking it over it seems that it is quite detailed and has in depth descriptions and photos of how to do a repair. I suppose that depending on your mechanical experience this could either be considered a strength or weakness.
